

Fiber Optic Reversibility Connector on Vibrating Plate

Overview

This study involves a Weibull reliability analysis focused on the performance of fiber optic connectors when they are subjected to mechanical random vibration stress to simulate real-world operating conditions, and the insertion loss (IL) degradation is measurable. By analyzing the testing times, light through SMA- and ST-type fiber-optic connectors. A multimode, fiber-optic link was vibrated from 0 to 10,000 Hz at a constant peak acceleration along the connector transverse and longitudinal axes. All other environmental parameters were ambient. Transfer characteristics through the connection. Fiber connectors are often used as the terminations of optical fiber cables to provide non-permanent connections between fiber-coupled devices (a kind of removable fiber joints). The ST connector is not suitable for space flight use and should only be used for ground support equipment if necessary (such as interfacing to existing instruments). LEMO specialises in designing and manufacturing high-performance.
