

PoE switch network cable connection method

Overview

Standard connection: Use one Ethernet cable, with one end plugged into the LAN port of the router and the other end plugged into any regular data port of the PoE switch (non Uplink port, some switches have dedicated Uplink ports for cascading, not used here). For networked devices, PoE eliminates the need for traditional alternating current (AC) power circuits and outlets. It utilizes efficient low-voltage 43 to 57 VDC over twisted-pair network cabling, such as Category 6A, Category 6, and Category 5e. This means PoE can be installed without risk to. The correct connection between PoE switches and routers is a key step in building a stable and efficient network. In this blog, we will guide you through the key steps to ensure a successful PoE. One of the biggest advantages of copper twisted pair Ethernet cable (also called Category cable) is it's ability to perform two critical functions at the same time: When these functions are simultaneously performed, it is known as PoE or Power over Ethernet.
