

Troubleshooting Long-Distance Optical Cable Faults

Overview

Good troubleshooting is a sequence, not a scattershot of tests. Start with the simplest, fastest checks (visual inspection, cleaning, cable routing) and only move to instrumentation (power meter, VFL, OTDR) when those steps don't clear the fault. This inexpensive tool that should be found in virtually every fiber technician's tool bag uses a bright laser beam of light (typically red) that can be easily seen by the human eye, unlike the invisible infrared light used by. This document presents a troubleshooting guide for fiber optic cables once deployed and in regular use. Maintenance personnel can refer to this document for step-by-step troubleshooting when dealing with faults arising from the following. Every optical link has key performance indicators (KPIs) that act as its vital signs. The two most critical are: Optical Power Level: Measured in decibels (dBm), this indicates the strength of the light signal. Receive Power (Rx): Too high (saturation) or too low (weak signal) can cause errors. Microbends and Macrobends What Happens Microbends are small-scale distortions in the fiber core caused by uneven pressure or tightly packed fibers.
